

CRICKSTATS

Phase 3: Project Design

Team Lead: A.G. Vasheela Afrin

Team Members: R. Sivasakthi, S. Subha

Platform: Salesforce (Lightning Experience)

1. Data Model

The design uses two main custom objects, Player and Match Performance, and an optional Team object. Match Performance is the child of Player (Master-Detail). Player has a Lookup to Team.

Relationship	Type	Reason
Match Performance to Player	Master-Detail	Enables roll-up summaries; performance cannot exist without a player
Player to Team	Lookup	A player can be linked to a team without depending on it

2. Object: Player

Field	Type	Notes
Player Name	Text / Name	Standard name field
Role	Picklist	Batsman, Bowler, All-rounder, Wicket-keeper
Team	Lookup(Team)	Optional
Age	Number	
Total Runs	Roll-up Summary	SUM of Runs Scored
Total Wickets	Roll-up Summary	SUM of Wickets
Matches Played	Roll-up Summary	COUNT of Match Performance
Highest Score	Roll-up Summary	MAX of Runs Scored

3. Object: Match Performance

Field	Type	Notes
Match Performance Name	Auto Number	e.g. MP-{0000}
Player	Master-Detail(Player)	Required
Match Date	Date	
Opponent	Text	
Venue	Text	
Runs Scored	Number	
Balls Faced	Number	
Wickets	Number	
Overs Bowled	Number	
Strike Rate	Formula	Runs Scored / Balls Faced x 100

4. Object: Team (optional)

Field	Type
Team Name	Text
City	Text

5. Application Design

- App name: CRICKSTATS (Lightning App)
- Navigation tabs: Players, Match Performances, Teams, Reports
- Player record page shows career totals and a related list of Match Performances

6. Automation Design

A Record-Triggered Flow on Match Performance runs after a record is created. It checks Runs Scored and Wickets and sets a performance flag or sends a notification. The exact action can be adjusted to the team's build.

7. Security Design

Access is controlled through profiles and permission sets. Coaches and admins can create and edit records; other users get read access.
