

CRICKSTATS

Cricket Player Performance Tracking Application
Project Documentation

Team Lead: A.G. Vasheela Afrin

Team Members: R. Sivasakthi, S. Subha

Platform: Salesforce (Lightning Experience)

1. Abstract

CRICKSTATS is a Salesforce-based application that records and tracks the performance of cricket players. Player details, matches and per-match performance are stored in custom objects. Roll-up summary fields and flows calculate and update totals automatically, so coaches and team managers can view player performance from a single Lightning App.

2. Problem Statement

Cricket statistics such as runs, wickets and matches played are often kept in scattered spreadsheets or on paper. This leads to duplicate data, calculation errors and slow reporting. A central, automated system is needed.

3. Objectives

- Store player, team and match data in one place.
- Record each player's performance for every match.
- Calculate career totals automatically using roll-up summary fields.
- Automate repetitive tasks using Flows.
- Provide an easy Lightning App with tabs for navigation.

4. Scope

In scope: player records, match records, performance records, automated totals, Lightning App.

Out of scope: live score feed, native mobile app, payments.

5. Tools and Technologies

Tool	Purpose
Salesforce Developer Edition	Free org for building and testing the application
Object Manager	Creating custom objects, fields and relationships
Lightning App Builder / App Manager	Building the CRICKSTATS Lightning App
Flow Builder	Automating business processes
Roll-up Summary Fields	Automatic totals on the parent object

6. System Design

The data model has three custom objects. Performance is the child object of Player (Master-Detail) and is linked to Match (Lookup). Because of the Master-Detail relationship, roll-up summary fields can be created on Player.

Object	Key Fields	Relationship
Player	Player Name, Role (Batsman / Bowler / All-rounder), Team, Age, Total Runs*, Total Wickets*, Matches Played*	Parent of Performance
Match	Match Name, Match Date, Venue, Opponent	Referenced by Performance (Lookup)
Performance	Runs Scored, Balls Faced, Wickets, Overs Bowled	Master-Detail to Player; Lookup to Match

* Roll-up summary fields (calculated automatically).

7. Implementation

Milestone 1: Salesforce Developer Account Creation

- Sign up for a free Developer Edition org on the Salesforce developer website.
- Verify the email address and set a password.
- Log in and open Setup.

Milestone 2: Object Creation

- Setup, then Object Manager, then Create, then Custom Object.
- Create Player, Match and Performance objects.
- Enable reports, activities and track field history as needed.

Milestone 3: Tabs

- Setup, then Tabs, then New (Custom Object Tabs).
- Create a tab for each object and choose a tab style.

Milestone 4: The Lightning App

- Setup, then App Manager, then New Lightning App, named CRICKSTATS.
- Add the Player, Match and Performance tabs as navigation items.
- Assign the app to the required user profiles.

Milestone 5: Fields and Relationships

- Create the custom fields listed in the System Design table.
- Create the Master-Detail relationship from Performance to Player.
- Create the Lookup relationship from Performance to Match.

Milestone 6: Roll-up Summary

- On Player, create Total Runs (SUM of Runs Scored).
- Create Total Wickets (SUM of Wickets).
- Create Matches Played (COUNT of Performance records).

Milestone 7: Flows

- Setup, then Flows, then New Flow.
- Build a Record-Triggered Flow that runs when a Performance record is created (for example, send an email or update a status field).
- Test, then activate the flow.

8. Testing

Test Case	Steps	Expected Result
Create a Player	Open the Player tab, click New, fill the details, save	Player record is saved
Roll-up totals	Add two Performance records to one Player	Total Runs equals the sum of both records
Matches Played	Add three Performance records	Matches Played shows 3
Flow	Create a Performance record	Flow runs and performs its action
Lightning App	Open the CRICKSTATS app	All three tabs are visible and working

9. Results

The application stores player, match and performance data and calculates career statistics automatically. Users can view all information from a single Lightning App.

Screenshots: [\(insert screenshots of the objects, app, roll-up fields and flow here\)](#)

10. Advantages, Limitations and Future Scope

Advantages

- Centralized data
- Automatic calculations
- No code required
- Easy to use

Limitations

- Manual data entry
- No live match feed

Future Scope

- Dashboards and reports
- Experience Cloud portal for fans
- AI-based performance predictions

11. Conclusion

CRICKSTATS shows how Salesforce's declarative tools (objects, relationships, roll-up summaries and flows) can be used to build a working sports performance tracker without writing code.

12. Team Contribution

Member	Role
A.G. Vasheela Afrin (Team Lead)	Planning, app design, final integration, demo
R. Sivasakthi	Developer account, objects, tabs, fields and relationships
S. Subha	Roll-up summary, flows, testing
